1.PYTHON CODE USED IN JUPYTER NOTEBOOK

```
# Importing the necessary libraries
import pandas as pd
import numpy as np
import seaborn as sns
import sklearn as sk
from sklearn import linear_model
from sklearn import tree
from sklearn import ensemble
from sklearn import svm

# Importing the Dataset
data=pd.read_csv(r"C:\Users\ganir\OneDrive\Desktop\traffic volume.csv")

# Analysing the Data
data.head()

data.describe()

data.info()

# Checking the null values
data.isnull().sum()

# Handling the missing values
data['temp'].fillna(data['temp'].mean(),inplace=True)
data['rain'].fillna(data['rain'].mean(),inplace=True)
```

```
data['snow'].fillna(data['snow'].mean(),inplace=True)

from collections import Counter

print(Counter(data['weather']))

data['weather'].fillna('Clouds',inplace=True)

data.isnull().sum()

# Encoding the data
from sklearn.preprocessing import LabelEncoder

le = LabelEncoder()

data['weather'] = le.fit_transform(data['weather'])

data['holiday'] = le.fit_transform(data['holiday'])

import matplotlib.pyplot as plt

data.corr()
sns.heatmap(data.corr())

data.head()

sns.pairplot(data)

data.boxplot()
```

```
data.corr()

# Splitting Date and Time
data[["day","month","year"]] = data["date"].str.split("-", expand = True)

data[["hours", "minutes", "seconds"]] = data["Time"].str.split(":", expand = True)

data.drop(columns=['date','Time'],axis=1,inplace=True)

data.head()

# Splitting The Dataset Into Dependent And Independent Variable
y = data['traffic_volume']
x = data.drop(columns=['traffic_volume'],axis=1)

names = x.columns

# Feature scaling
from sklearn.preprocessing import scale

x = scale(x)

x = pd.DataFrame(x,columns=names)

x.head()

# Splitting The Data Into Train And Test
from sklearn.model_selection import train_test_split
```

```
x_train,x_test,y_train,y_test = train_test_split(x,y,test_size=0.2,random_state =0)

# Training And Testing The Model
# Initializing the model
from sklearn import linear_model
from sklearn import tree
from sklearn import ensemble
from sklearn import svm
import xgboost

# Fitting the models with x_train and y_train
lin_reg = linear_model.LinearRegression()
Dtree = tree.DecisionTreeRegressor()
Rand = ensemble.RandomForestRegressor()
svr = svm.SVR()
XGB = xgboost.XGBRegressor()

# Fitting the models with x_train and y_train
lin_reg.fit(x_train,y_train)
Dtree.fit(x_train,y_train)
Rand.fit(x_train,y_train)
svr.fit(x_train,y_train)
XGB.fit(x_train,y_train)

# Predicting the y_train values and calculate the accuracy
p1 = lin_reg.predict(x_train)
p2 = Dtree.predict(x_train)
p3 = Rand.predict(x_train)
```

```
p4 = svr.predict(x_train)
p5 = XGB.predict(x_train)

# Regression Evaluation Metrics
from sklearn import metrics

#  R-squared _score
print(metrics.r2_score(p1,y_train))
print(metrics.r2_score(p2,y_train))
print(metrics.r2_score(p3,y_train))
print(metrics.r2_score(p4,y_train))
print(metrics.r2_score(p5,y_train))

p1 = lin_reg.predict(x_test)
p2 = Dtree.predict(x_test)
p3 = Rand.predict(x_test)
p4 = svr.predict(x_test)
p5 = XGB.predict(x_test)

print(metrics.r2_score(p1,y_test))
print(metrics.r2_score(p2,y_test))
print(metrics.r2_score(p3,y_test))
print(metrics.r2_score(p4,y_test))
print(metrics.r2_score(p5,y_test))

# RMSE –Root Mean Square Error
MSE = metrics.mean_squared_error(p3,y_test)

np.sqrt(MSE)
```

```
# Saving the Model
import pickle

pickle.dump(Rand,open("model.pkl",'wb'))
pickle.dump(le,open("encoder.pkl",'wb'))
```

2.PYTHON CODE USED FOR APP BUILDING

```
import numpy as np
import pickle

import time
import pandas
import os
from flask import Flask, request, render_template

app = Flask(__name__,template_folder='Template')
model = pickle.load(open(r"D:\Traffic volume estimation project\flask\Template\model.pkl",'rb'))

@app.route('/')# route to display the home page
def index():
    return render_template('index.html') #rendering the home page

@app.route('/predict',methods=["POST","GET"])# route to show the predictions in a web UI
def predict():
```

```
    #  reading the inputs given by the user
    input_feature=[float(x) for x in request.form.values() ]
    features_values=[np.array(input_feature)]
    names = [['holiday','temp', 'rain', 'snow', 'weather', 'year', 'month', 'day','hours',
'minutes', 'seconds']]
    data = pandas.DataFrame(features_values,columns=names)
     # predictions using the loaded model file
    prediction=model.predict(data)
    print(prediction)
    text = "Estimated Traffic Volume is :"
    return render_template("output.html",result = text + str(prediction) + "units")
     # showing the prediction results in a UI
if __name__=="__main__":

    # app.run(host='0.0.0.0', port=8000,debug=True)    # running the app
    port=int(os.environ.get('PORT',5000))
    app.run(port=port,debug=True,use_reloader=False)
```

Let us build an app.py flask file which is a web framework written in python for server-side scripting. Let's see step by step procedure for building the backend application.

In order to develop web API with respect to our model, we basically use the Flask framework which is written in python.

Line 1-9 We are importing necessary libraries like Flask to host our model request

Line 12 Initialise the Flask application

Line 13 Loading the model using pickle

Line 16 Routes the API URL

Line 18 Rendering the template. This helps to redirect to the home page. In this home page,we give our input and ask the model to predict

In line 23 we are taking the inputs from the form

Line 28 Feature Scaling the inputs

Line 31 Predicting the values given by the user

Line 32-35 if the output is false render no chance template If the output is True render chance template

Line 36 The value of __name__ is set to __main__ when the module run as the main program otherwise it is set to the name of the module .
